Uranium hexafluoride (U F 6), colloquially known as "hex" in the nuclear industry, is a compound used in the process of enriching uranium, which produces fuel for nuclear reactors and nuclear weapons. Hex forms solid grey crystals at standard temperature and pressure, is highly toxic, reacts with water, and is corrosive to most metals. The compound reacts mildly with aluminium, forming a thin ...

Atomic layer deposition (ALD) is a thin-film deposition technique based on the sequential use of a gas phase chemical process; it is a subclass of chemical vapour deposition. The majority of ALD reactions use two chemicals called precursors. These precursors react with the surface of a material one at a time in a sequential, self-limiting, manner.

Until April 1945, almost 9000 tonnes of tabun, 1300 tonnes of sarin and 20 tonnes of soman were mass-produced by the Nazi regime, however, they were never used (Halámek and Koblíha, 2011). There has been a considerable debate about why the Germans did not use their chemical arsenal in the World War II.

For the vast majority of science fiction worldbuilding, the major alteration to the laws of physics is allowing some species of faster-than-light propulsion for their starships. Others will add things like psionics/psychic abilities. But besides those, the rest of the laws of physics operate exactly as in real life.

Drugs that inhibit cholinesterases. The neurotransmitter ACETYLCHOLINE is rapidly hydrolyzed, and

thereby inactivated, by cholinesterases. When cholinesterases are inhibited, the action of endogenously released acetylcholine at cholinergic synapses is potentiated.

This article has been 15 years in the making, as it took that long for me to be able to distill this information into an accessible format. This is going to represent a few very important pieces of the overall puzzle of how we are going to shift this planet and everyone upon it into an ascended frequency of being.
