Computed Tomography In Head Injuries

Computed tomography (CT) scanning of the head uses a series of x-rays of the head taken from many different directions; the resulting data is transformed into a series of cross sections of the brain using a computer program. CT images of the head are used to investigate and diagnose brain injuries and other neurological conditions, as well as other conditions involving the skull or sinuses

A CT scan, also known as computed tomography scan, and formerly known as a computerized axial tomography scan or CAT scan, makes use of computer-processed combinations of many X-ray measurements taken from different angles to produce cross-sectional (tomographic) images (virtual "slices") of specific areas of a scanned object, allowing the user to see inside the object without cutting.

What is a CT scan of the brain? (Head CT Scan, Intracranial CT Scan) A CT of the brain is a noninvasive diagnostic imaging procedure that uses special X-rays measurements to produce horizontal, or axial, images (often called slices) of the brain. Brain CT scans can provide more detailed information about brain tissue and brain structures than standard X-rays of the head, thus providing more ...

Bleeding or swelling in the brain can cause pressure that forces the brain downward in the skull. The result may be a herniation, in which brain tissue is forced through a small natural opening in the relatively rigid sheets of tissue that separate the brain into right and left compartments and into upper and lower compartments.

Thoracic trauma may present as an isolated rib fracture, a chest contusion, or a laceration; however, significant thoracic trauma often involves multiple organ systems and several anatomic regions. The chest trauma that results from a motor vehicle accident may result in injury to the sternum, the ribs, and the heart, aorta, and lungs.
