Analyses of biodegradative bacteria include diverse areas of study, such as genetics, enzymology, genomics, cell physiology, ecology, and evolutionary biology. In other words, the targets investigated in research on biodegradative bacteria include single molecules, single cell systems, bacterial consortia (interaction with surrounding microorganisms), and interaction with surrounding biotic and abiotic materials.

Biodegradative Bacteria - How Bacteria Degrade, Survive ...

Physiology of microorganism 1. • Antisepsis is the destruction or inhibition of microorganisms on a living tissue; it is the prevention of infection or sepsis. • Antiseptics are chemical agents applied to tissue to prevent infection by killing or inhibiting pathogen growth; they also reduce the total microbial population.
